SUMMARY

Solutions Engineer and Mechatronics Engineer who ships production AI with customers: discovery, solution design, Python/LLM systems, and handover to product and engineering. Current work is customer-facing applied AI — agentic workflows, tool use, and turning one-off client needs into repeatable capabilities. Looking to do that work where the robots are, on FieldAI's field-ready stack.

WHY ROBOTICS, AND WHY NOW

This is a deliberate move into robotics, not an opportunistic application. I trained as a mechatronics engineer because robots are what I care about, and the last two years took me deep into applied AI and cloud. The thing I want to build for the rest of my career is the intersection: **physical robots made useful by AI**, deployed at a real customer site.

- **The robotics foundation is real:** mechatronics degree, ROS work on differential-drive trajectory control (Lyapunov, odometry, Gazebo, MATLAB/Simulink) validated in both simulation and hardware, and a CNC I designed the electronics, firmware, and safety for.
- **Currently learning ROS 2**, building on the ROS 1 experience above. I am explicit about where I am on that curve rather than overstating it.
- **The AI half is my day job**, not a side interest: production LLM and agentic systems shipped with customers.

FieldAI is where those two halves stop being separate résumé sections.

RELEVANT EXPERIENCE

Solutions Engineer — Truora · Bogotá, Colombia · Oct 2025–present

- Technical counterpart in customer conversations: leads discovery on architecture, workflows, pain points, and success criteria, then turns that into a concrete solution path.
- Designs and delivers tailored demos and proofs of concept; partners with sales, product, and engineering so the work becomes a reusable capability rather than a one-off custom build.
- Builds and operates production LLM / agentic workflows used in pre-sales and pilot operations — tool use, orchestration, and iteration from prototype to something the team can run again.
- Public, anonymized view of that operating system: theker.velasquezlopez.com.

Named Accounts Cloud Solutions Architect — Huawei · Bogotá, Colombia · Jul 2024–Jul 2025

- Owned technical discovery and end-to-end solution design for named enterprise accounts, trading off performance, availability, cost, scalability, and security.
- Led the architecture for a cloud migration for a major Colombian betting/tech company.
- Delivered technical trainings and webinars on AI and Kubernetes across Colombia and Ecuador — translating complex systems for mixed technical and business audiences.

Cloud Solutions Architect Intern — Huawei · Bogotá, Colombia · Feb–Jul 2024

- Supported solution architects with market analysis, client communication, and proposal work. First exposure to ambiguous, cross-functional enterprise delivery.

Independent AI & Automation Consultant — UnMecaNiko · Bogotá, Colombia · Jul–Sep 2025

- Shipped client and personal products that solve real workflow problems: multi-agent assistants, document automation, and production integrations (Python, n8n, APIs, cloud).

SELECTED WORK THAT MAPS TO THIS ROLE

This résumé is itself the output of an agentic system I built. It was generated from a personal *context repository* — a structured knowledge base about my career built with harness engineering and deliberate context management, so that agents working against it can:

- ground themselves in who I am and what I have actually done, with every claim traceable to a source document;
- score my match against a specific role or job description from several points of view, and name the gaps instead of hiding them;
- draft a résumé tailored to that role, with unverified data explicitly flagged rather than invented.

That last constraint is the point: the harness is designed so the agent *cannot* quietly fabricate a credential. It is the same discipline this role needs — turning a customer's messy context into a system that produces reliable, repeatable output.

Agentic pre-sales operating system — designed an agent-assisted system for discovery, research, and pilot operations. The public, anonymized walkthrough is thekevelasquezlopez.com. This is the closest artifact to “codify repeatable implementation patterns into playbooks.”

DomiChat — multi-agent WhatsApp assistant (Gemini, n8n, Supabase) that takes a real logistics workflow from voice/text request to rider match. Built as a production-shaped LLM application, not a notebook demo. domichat.com.co

CNC Magia Roja — designed and integrated electronics, firmware (GRBL), stepper motors, sensors, wiring, and safety on a working CNC used in a family business. Comfortable sitting next to hardware, not only APIs.

TurtleBot trajectory control — ROS, Gazebo, MATLAB/Simulink; validated in simulation and on hardware.

WHY THIS IS A FIELD AI SOLUTIONS PROFILE

- **Customer discovery → shipped system:** the Truora and Huawei loop is the same loop this role describes: understand the workflow, build the thing, measure whether it worked, hand a reusable version to product.
- **Production LLM and agentic systems:** agents, tool use, and workflow orchestration are current daily work, not a course certificate.
- **High ownership in ambiguity:** moved across cloud architecture, applied AI, and hands-on mechatronics; each time the job was to make something run for a real user.
- **Hardware is not foreign:** mechatronics degree, CNC integration, and robot control work mean field deployments and sensor talk are native, not a translation exercise.
- **Relocation is decided:** available to move to Irvine and travel to customer sites (~10%) as soon as FieldAI wants a start date.

EDUCATION & CERTIFICATIONS

- **Mechatronics Engineering** — Universidad Militar Nueva Granada, 2019–2023.
- **HCIP Cloud Service Solutions Architect** — Huawei, 2025.
- **HCIA Artificial Intelligence** — Huawei, 2024.
- **HCIA Cloud Service** — Huawei, 2024.
- **Professional Scrum Course** — Scrum.org.
- **MCP (Model Context Protocol)** — Platzi, 2025.
- **English** — Advanced (CEFR C1, EF).

ACHIEVEMENTS

- Senior champion, UMNG Programming Olympics (2021).
- Robotics category champion, UMNG Engineering Week (2022).
- Second place, Innovation category, Latin American Innovation Rally (2023).
- Judge, World Robot Olympiad Colombia (2023).
- Scientific instructor, Space Call — trained the team that built a board integrated into the RASCube-1 CubeSat, launched in 2025.
